### **Task: Drive Data Analysis**

Attached is data from our car taken from the endurance event at a previous FSUK competition. There is data from two different drivers. The driving was done in wet conditions.

Plot the channels you think are most useful for Performance analysis. There is no right answer - you can plot a single lap, all the data, laps overlayed etc. Use the data to produce some conclusions about the car/ driver performances. This can be focused on whatever you are interested in e.g. vehicle dynamics, engine performance or driver coaching. Additionally, consider what other channels would be useful to have to enhance your analysis and how you could measure/ calculate these.

Please summarise your conclusions and explain if/ how you used AI in this task (if possible, attach a link to your AI chat).

The data is in one large csv per driver so below are the lap times to help you split up the data:

| Lap no. | Time at end of lap (s) |          |
|---------|------------------------|----------|
|         | Driver 1               | Driver 2 |
| 1       | 113.901                | 40.594   |
| 2       | 190.353                | 117.581  |
| 3       | 261.857                | 191.908  |
| 4       | 331.104                | 264.67   |
| 5       | 398.652                | 338.821  |
| 6       | 466.026                | 413.768  |
| 7       | 536.357                | 487.82   |
| 8       | 605.743                | 561.371  |
| 9       | 671.024                | 636.068  |
| 10      | 736.401                | 708.539  |
| 11      | 808.066                | 783.379  |
| 12      | 873.338                | 862.935  |
| 13      | 938.436                | 940.344  |
| 14      | 1003.34                | 1036     |
| 15      | 1083                   |          |

**Deliverable:** PDF of conclusions and AI use uploaded to the website. Please send the file used to process the data to me by email.

**Please reach out with any questions!**
